

Korean Parsing in an Extended Categorial Grammar

RASLAN 2011
2nd-4th Dec 2011

By Juyeon Kang
2nd of Dec 2011

FI Masaryk University, Brno, Czech Republic

Outline

- Korean Language
- Linguistic characteristics of Korean

1. Motivation
2. Theoretical framework : Applicative Cognitive Grammar
 - CG Formalisms
 - Combinatory Logic
 - ACCG
3. ACCG parser
4. Conclusion

About Hangul

- **Hangul** is the name of the Korean language.
- It was created by king Sejong, the 4th ruler of the Chosun Dynasty in 1443.

* Before Hangeul was invented, our nation used our own language and borrowed Chinese letters to write. But, Chinese characters were difficult to use and could not express all of our words.

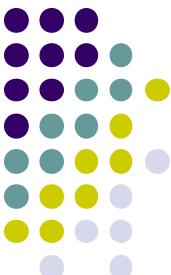

Communication in Korean

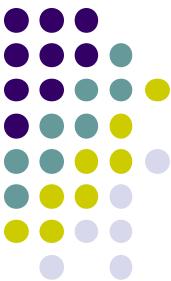

Writing in Chinese

Korean Letters were needed

(1) Basic Consonants and Vowels(24 letters) =Consonants(14 letters) + Vowels(10 letters)

C o n s o n a n t s			
Letter	Name [Pronunciation]	Letter	Name [Pronunciation]
ㄱ	giyeok [kjʌk]	ㅏ	a [a]
ㄴ	nieun [niɯn]	ㅑ	ya [ja]
ㄷ	digeut [tigwt]	ㅓ	eo [ʌ]
ㄹ	rieul [riwʌl]	ㅕ	yeo [jʌ]
ㅁ	mieum [miɯm]	ㅗ	o [o]
ㅂ	bieup [piɯp]	ㅛ	yo [jo]
ㅅ	siot [ʃiot]	ㅜ	u [u]
ㅇ	ieung [iɯŋ]	ㅠ	yu [ju]
ㅈ	jieut [tʃiwt]	ㅡ	eu [ɯ]
ㅊ	chieut [tʃʰiwt]	ㅣ	i [i]
ㅋ	kieuk [kʰiwk]		
ㅌ	tieut [tʰiwt]		
ㅍ	pieup [pʰiɯp]		
ㅎ	hieut [hiwt]		

Linguistic characteristics of Korean

1) Typical SOV language

2) Variable word order

ex1 : eoje Eugene-i show-reul bo-ass-da

yesterday Eugene-NOM show-ACC watch-PS-DC

Eugene watched a show yesterday.

ex2 : eoje show-reul Eugene-i bo-ass-da

yesterday show-ACC Eugene-NOM watch-PS-DC

Eugene watched a show yesterday.

3) Word order typology :

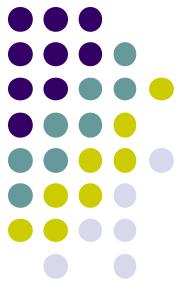

Dem+Num (+CL) +ADJ+N, GenN+HeadN, Rel Cl+N, Verb stem+Aux, N+Case marker

ex : jeo se gae-uy jakeun inhyeong

Dem three-CL-GEN little doll

those three little dolls

Linguistic characteristics of Korean (Cont.)

5) Double nominative/accusative construction, double topic construction

ex. Double topic :

Minju-neun umma-neun geurip-da

Minju-TOP mother-TOP miss-DC

Minju missed mother (but not father)

ex. Double accusative:

Minju-ga Inho-reul son-eul jap-ass-da

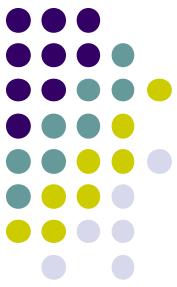

Minju-NOM Inho-ACC hand-ACC hold-PS-DC

Minju held Inho's hand.

6) Verbs consists of a lexical stem and suffixs

ex : **joah-ass-da (liked)**

like-Past-Declarative ending

1. Motivations

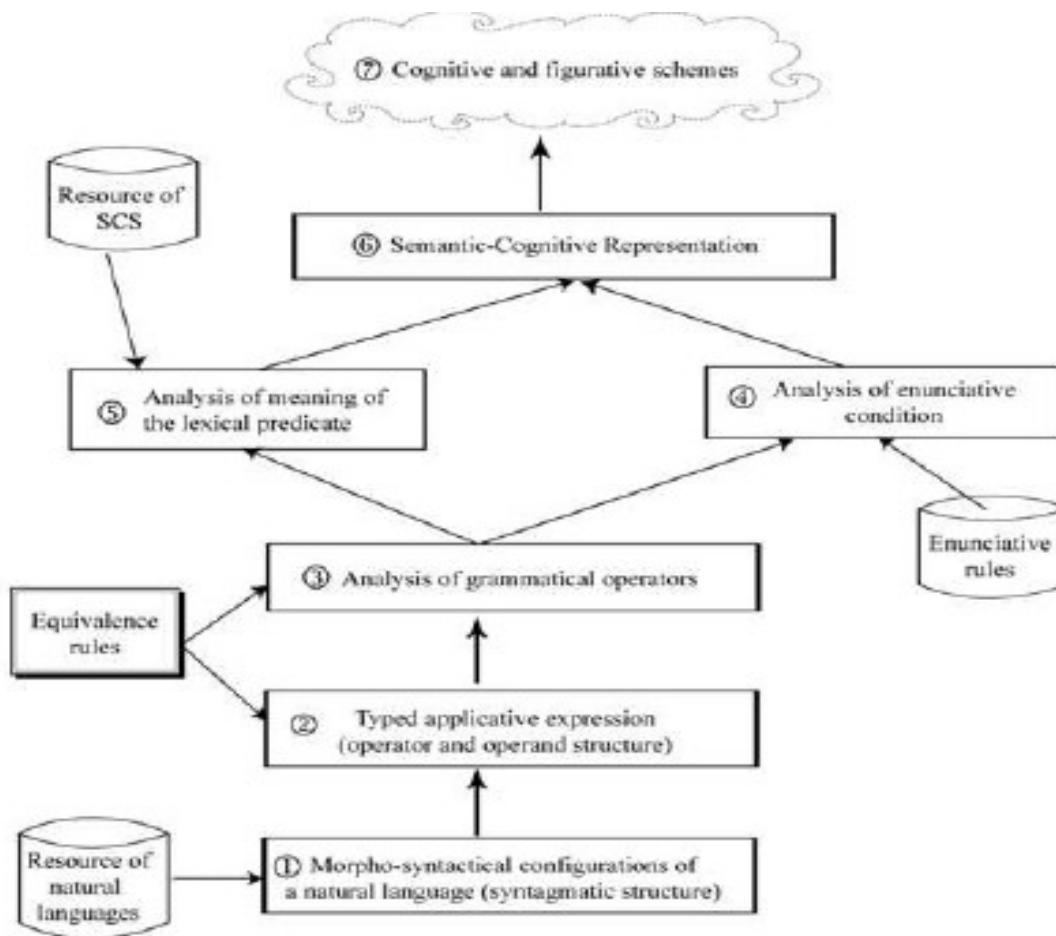

- **Formal analysis of different complex syntactic problems for an efficient parsing**
- **Argument the anti-anti relativism hypothesis (epistemological point of view)**
- **Develop a categorial analysis system adequate to the processing of complex syntactic problem**

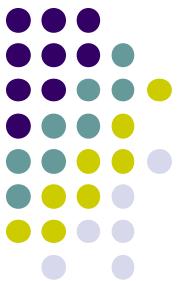

2. Theoretical framework :

Cognitive and Applicative Grammar (CAG)

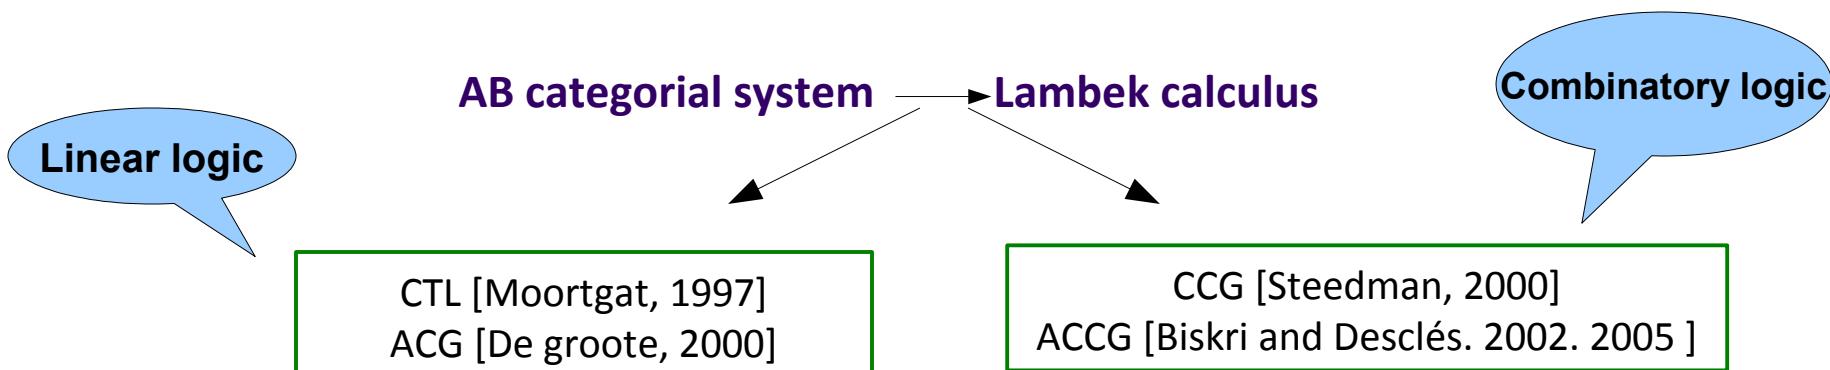

- Analogue to a compiling program with 7 interrelated levels of representations [Desclés, 2005]

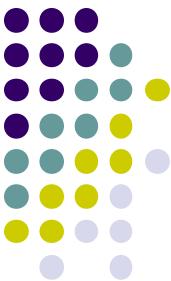

CG formalisms

- Systems of types analogue to Church's functional types
- Instance of types are linguistic units analyzed as operators and operands
- Calculus on types → application of operators to operands
- Basic functional types :
 S for sentence, N for noun and N* for the noun phrase
- Two axes of CG extension

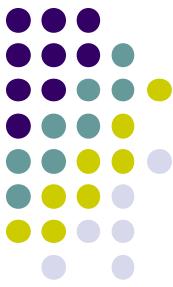

Combinatory Logic

Logic of operators with abstract operators, « combinators »

- Operators with assigned types can be composed by different ways [Curry and Feys, 1958]
- Combinators are introduced and eliminated by β -reduction rules in Gentzen's style [Fitch, 1974]

$$\begin{array}{ccc} \boxed{\mathbf{Bxyz} \quad \geq_{\beta} \quad x(yz)} \\ \downarrow \\ \boxed{\begin{array}{cc} \mathbf{Bfxy} & f(xy) \\ \cdots \text{---} [\mathbf{e} \cdot \mathbf{B}] & \cdots \text{---} [\mathbf{i} \cdot \mathbf{B}] \\ f(xy) & \mathbf{Bfxy} \end{array}} \end{array}$$

Applicative Combinatory Categorial Grammar

- Extension of Combinatory Categorial Grammar [Biskri and Desclès, 2005]
- Canonical associations between categorial rules and combinators without binding variables

Functional composition

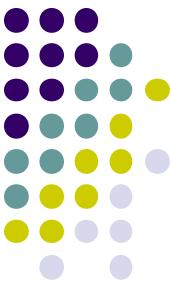

$$\frac{[X/Y : u_1] - [Y/Z : u_2]}{\text{-----} > B}$$

$$\frac{[Y/Z : u_1] - [X\backslash Y : u_2]}{\text{-----} < Bx}$$

$$[X/Z : (B u_1 u_2)]$$

$$[X/Z : (B u_2 u_1)]$$

- Combinators controls : two types of meta-rules
 - combinatory meta-rules and contextual meta-rules
- Use of schema type (e.g. X/X for the operation of determination)
- Module integrated in the CAG

● Meta-rule system

- Contextual meta-rules (*POS Tagging ambiguities*)

Exemple: 소희가 나무에 (-e) 물을 준다. (Sohee waters the trees.)

일요일에 (-e) 보자. (See you on sunday.)

« Contextual condition 1 for the marker -e »

If the marker **-e** is followed of a binary verb of type $(S \setminus N^*) \setminus N^*$, then this marker fonctions as a determinative case suffix of dative, we assign the type of « determinative constructor » $((S \setminus N^*) / (S \setminus N^*) / N^*) \setminus N$ to **-e**.

- Flexible word order

박 장관이 파리의 모 음식점에서 김 을 만났다.

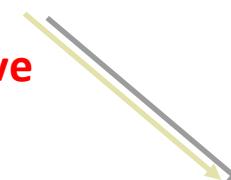

Pak janggwani Parisuy mo eumsikjeomeso Kim-eul manassda.

Pak minister-Nom Paris-Gen restaurant-Loc Kim -Acc meet-Ps-Dc

« The minister Pak met Kim in a restaurant of Paris. »

a. N₁-i (N₂-uy N₃-eso) N₄-eul P3

N₁-Nominative (N₂-Genitive N₃-Loc) N₄-Accusative

a. N₁-i N₄-eul (N₂-uy N₃-eso) P3

Predicative representation

b. (N₂-uy N₃-eso) N₁-i N₄-eul P3

c. (N₂-uy N₃-eso) N₄-eul N₁-i P3

d. N₄-eul N₁-i (N₂-uy N₃-eso) P3

Ph a. Ph b. Ph c. Ph d. Ph e.

Categorial calculus

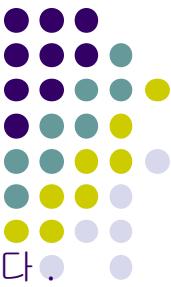

Introduction of combinators

- a. $((B(B(C^*(-i N1) \ C^*(-uy N2 \ -eso N3)) \ C^*(-eul N4))) \ meet)$
- b. $(B(C^*(-i N1) \ Bx(C^*(-eul N4) \ C^*(-uy N2 \ -eso N3))) \ meet)$
- c. $(B(Bx(C^*(-uy N2 \ -eso N3)) \ C^*(-i N1)) \ C^*(-eul N4)) \ meet)$
- d. $(Bx(B(C^*(-uy N2 \ -eso N3)) \ C^*(-eul N4)) \ C^*(-i N1)) \ meet)$
- e. ...

Reduction of the applied
combinators

$((((meet(-eul N4)) \ (-uy N2 \ -eso N3)) \ -i N1)$

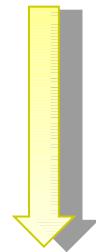

- Coordination + Positionnement croisé + Thématisation

Ex: 장미값이 [소피는 비싸다] 고 생각하고 [폴은 저렴하다] 고 생각한다.
 Janmigabs-i [Sophie-neun bissada]-go saengakha-go [Paul-eun jeoryeomhada]-go saenghanda
 price of rose-**Th.E** Sophie-**Th.I** expensive-**Compl.** think-**Conj.** Paul-**Th.I** cheap-**Compl.** think

Sophie thinks that the price of rose is expensive and Le prix de rose, Sophie le trouve cher mais Paul le trouve bon marché.

(C*-i jangmigabs) {Φ -go {(C*-neun Sophie)(saengakha(bissada-go))}{(C*-neun Julie)(saengakhan-da(jeoryeomhada-go))}}

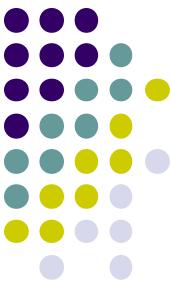

Reduction of the applied
combinators

Forme Normale

-go {{(saengakha(bissada-go))-neun Sophie}-i jangmigabs}

{}{{(saengakhan-da(jeoryeomhada-go))-neun Julie}-i jangmigabs}}

3. ACCG parser

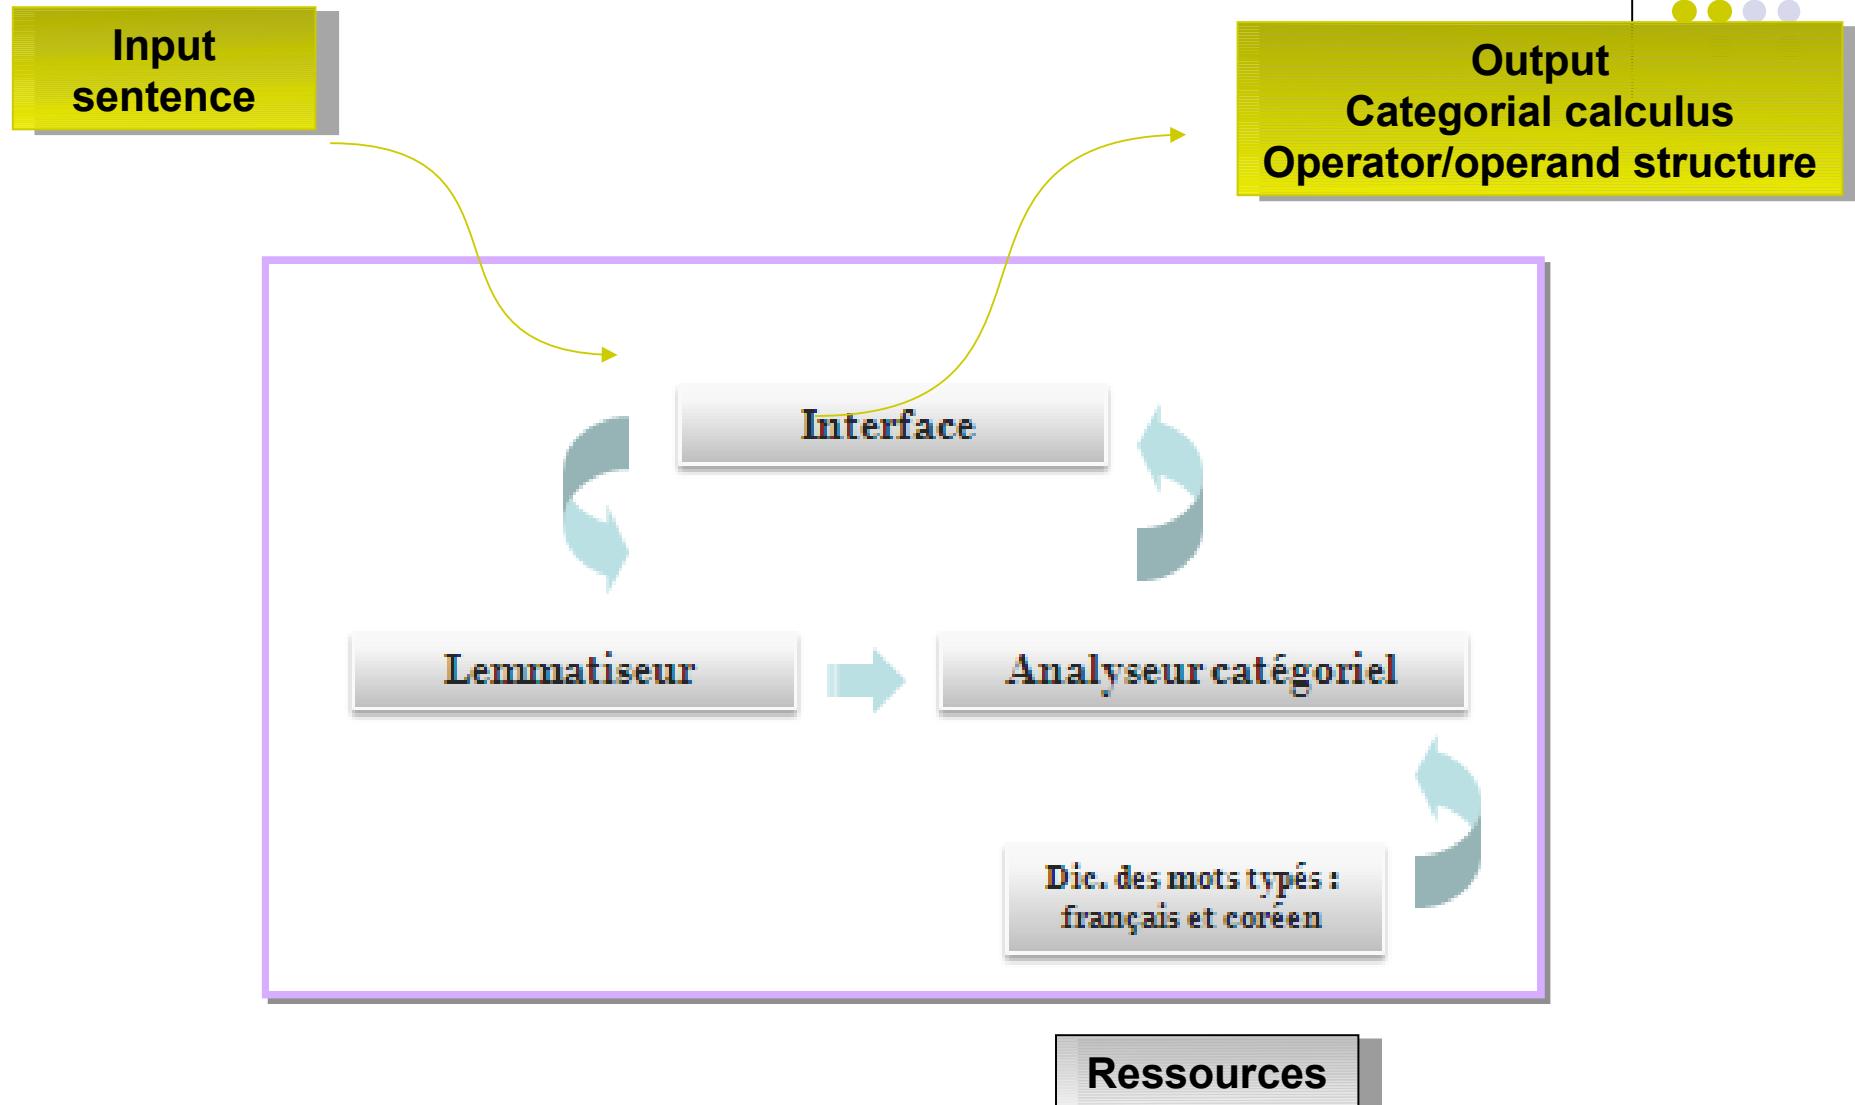

- **Objectifs**

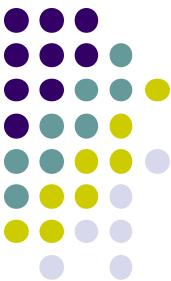

Develop a categorial analyzer which allows to

- give an extended catgorial calculus
- generate operator/operand structure
- handle french and korean
- take into accouunt the complex linguistic phenomenon

General structure of the parser

- Résultats comparatifs _ Comparaison de résultats(b)

- Phrase2 de Texte-1: ACCG (coréen)

지친 하루의 일을 마치고 ,
Jichin haru-uy il-eul machi-go
hard day-Gen work-Acc finish-Comp.

마리는 습관처럼 공원에서 한 시간 동안 산책을 하곤 했어요
May-neun seupgwancheoreom gongwon-eso han sigan dongan sanchaek-eul hagon hae-ss-eyo
Mary-Th.I usually park-Loc an hour during working-Acc do-S.V(habit) do-Ps-Nar.

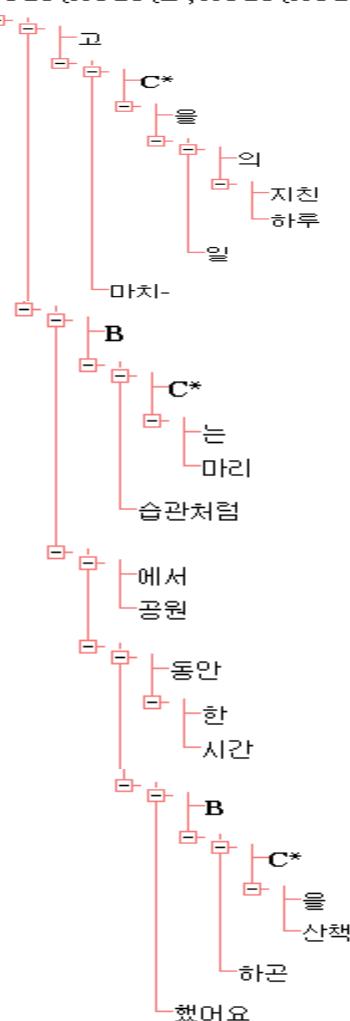

After a hard working day, Mary usually worked during an hour in the park

Calcul Catégoriel :

Type syntaxique : S

Arbre applicatif: Node(Node(Feuille= 고, Node(Node(C*, Node(Feuille= 을, Node(Node(Feuille= 의, Node(Feuille= 지, Feuille= 친, Feuille= 하루)), Feuille= 일))), Feuille= 마치-)), Node(Node(B, Node(Node(C*, Node(Feuille= 는, Feuille= 마리)), Feuille= 습관처럼)), Node(Node(Feuille= 에서, Feuille= 꿈원), Node(Node(Feuille= 동안, Node(Feuille= 한, Feuille= 시간)), Node(Node(B, Node(Node(C*, Node(Feuille= 을, Feuille= 산책)), Feuille= 하곤)), Feuille= 했어요))))))

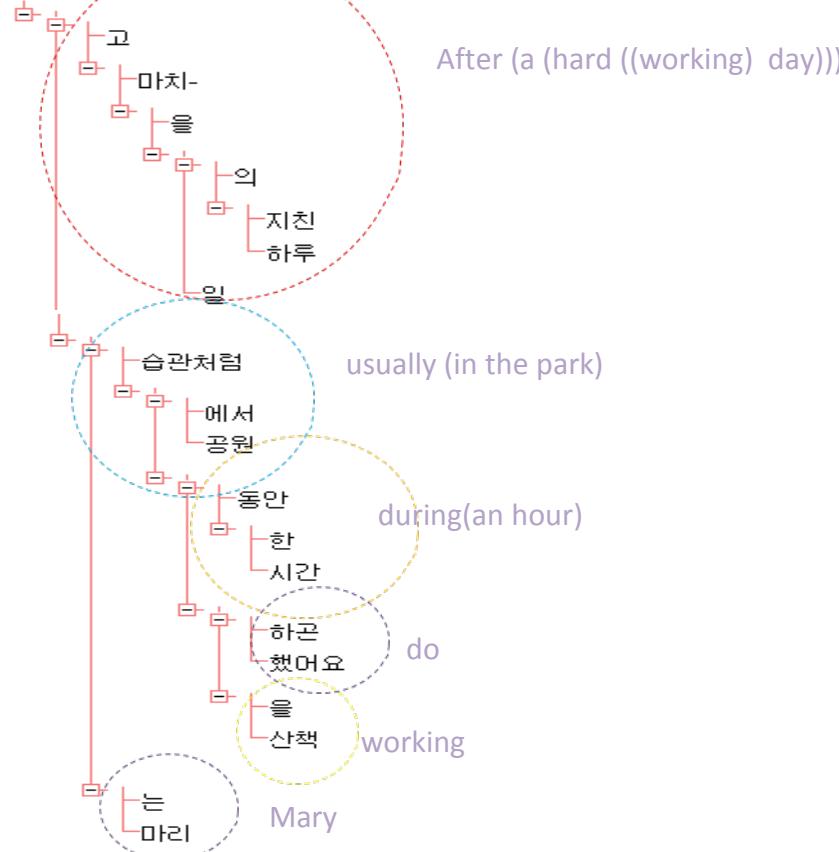

Expression combinatoire: (((고 (((C* 을 ((의 (지친 하루)) 일)) 마치-)) ((B (C* 는 마리) 습관처럼) ((에서 공원) ((동안 (한 시간)) ((B 하 곤 (C* 을 산책)) 했어요))))

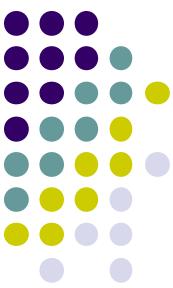

Structure Applicative (Forme Normale) :

Type syntaxique : S

Arbre applicatif: Node(Node(Feuille= 고 ,Node(Feuille= 마치- ,Node(Feuille= 을 ,Node(Node(Feuille= 의 ,Node(Feuille= 지친 ,Feuille= 하루))),Feuille= 일))),Node(Node(Feuille= 습관처럼 ,Node(Node(Feuille= 에서 ,Feuille= 공원),Node(Node(Feuille= 동안 ,Node(Feuille= 한 ,Feuille= 시간))),Node(Node(Feuille= 하곤 ,Feuille= 했어요),Node(Feuille= 을 ,Feuille= 산책))))),Node(Feuille= 는 ,Feuille= 마리)))

Représentation applicative: (((고(마치-(을((의(지친 하루)) 일))))((습관처럼((에서 공원)((동안(한 시간))((하곤 했어요)(을 산책))))((는 마리))))(는 마리)))

4. Conclusion

- The ACCG can be a solution for an efficient Korean parsing by allowing to handle important morphological and syntactical problems.
- The ACCG Parser allow to generate the morpho-syntactic calculus and operator/operand structure by considering the case marker in Korean as operators.
- The parser evaluation is not still enough in order to estimate the exact parsing accuracy.
- The parser requires to use a supertagging system[Curran and Clark, 2002, 2007] for a wide-coverage.

Thank you for your attention !
